

UNIVERSAL WEBSITE QUALITY DIRECTIVE

Eliminate AI Filler, Template Thinking, and Unnecessary Design

Apply these instructions to the entire website-generation task, regardless of the project type, industry, framework, visual style, or existing design context.

Your goal is not to generate the largest, busiest, or most conventionally “complete” website possible.

Your goal is to create the **smallest complete website that communicates the idea clearly, supports the user’s goals, feels intentionally designed, and contains no unnecessary material.**

Treat every section, sentence, component, decoration, and interaction as something that must earn its place.

PRIORITY 0 — UNDERSTAND THE ACTUAL PROJECT

Before designing or coding, identify:

- What the website is offering
- Who it is for
- What visitors should understand
- What visitors should do
- What information already exists
- What information is missing
- Which parts are functional requirements
- Which parts are merely optional conventions

Do not automatically convert a vague brief into a generic startup landing page.

Do not assume the website needs:

- A feature grid
- Testimonials
- Pricing
- Statistics
- A process section
- FAQs
- Partner logos
- A newsletter
- A team section
- Multiple calls to action
- A large footer sitemap

Only add these when they are supported by the project and useful to the visitor.

Never invent content merely to make the page appear complete.

When information is unavailable, use a clearly identified placeholder only when necessary. Do not fabricate facts, customers, numbers, testimonials, features, awards, partnerships, or product capabilities.

PRIORITY 1 — REMOVE ALL CONTENT THAT DOES NOT ADD MEANING

The page must not contain decorative or explanatory filler that merely announces what the visitor can already see.

Avoid automatic section labels such as:

- FEATURES
- ABOUT US
- OUR APPROACH
- WHAT WE DO
- THE PROCESS
- WHY CHOOSE US
- SOLUTIONS
- OUR MISSION

A small section label may only be used when it provides useful orientation, contrast, chronology, navigation, or context that the main heading does not already communicate.

Do not place a tiny uppercase label above every heading.

Do not give every section:

1. An eyebrow label
2. A large heading
3. A supporting heading
4. An introductory paragraph

Use only the amount of hierarchy the content genuinely needs.

Do not repeat the same idea in the label, heading, paragraph, cards, and call to action.

Bad pattern:

FEATURES

Powerful Features

Explore our powerful features designed to help you succeed.

Better pattern:

Everything required to publish and manage your work.

Avoid paragraphs that merely restate their headings.

Avoid generic introductory language before reaching the actual point.

Start with useful information.

PRIORITY 2 — USE SUBTRACTIVE DESIGN

Do not add an element because it looks good in isolation.

Add it only when it improves at least one of the following:

- Understanding
- Navigation
- Decision-making
- Credibility
- Interaction
- Accessibility
- Emotional impact appropriate to the brand

Before adding anything, ask:

What information or function would be lost if this were removed?

If the honest answer is “nothing,” remove it.

Apply this test to:

- Sections
- Cards
- Icons
- Labels
- Badges
- Statistics
- Borders
- Dividers

- Background objects
- Animations
- Buttons
- Captions
- Illustrations
- Decorative typography

The final page should feel edited, not accumulated.

PRIORITY 3 — DO NOT TURN EVERYTHING INTO CARDS

Cards are not the default container for website content.

Do not place ordinary text inside separate rounded rectangles without a functional reason.

Do not create three feature cards merely because three-column layouts are common.

Do not use cards when:

- The information reads better as one paragraph
- A simple list would be clearer
- The items are not meaningfully separate
- There is no interaction attached to them
- The visual separation creates unnecessary complexity

Avoid:

- Cards inside cards
- Multiple nested panels
- A bordered container around every section
- An icon box inside every card
- Repeated rows of identical cards
- Bento grids with no meaningful hierarchy

Use open layout, spacing, typography, imagery, and alignment before adding containers.

Cards should represent actual units such as:

- Products
- Articles
- Profiles
- Projects
- Search results
- Plans

- Interactive tools
- Distinct pieces of structured data

They should not be used as decorative packaging for every sentence.

PRIORITY 4 — AVOID GENERIC AI LANDING-PAGE STRUCTURE

Do not automatically generate this sequence:

1. Navigation
2. Hero
3. Logo marquee
4. Three feature cards
5. Statistics
6. Process
7. Testimonials
8. Pricing
9. FAQ
10. Final CTA
11. Large footer

Build the information architecture around the project itself.

Sections may have different lengths, visual structures, and densities when the content requires it.

Do not force every idea into a symmetrical three- or four-column grid.

Do not create multiple sections that express slightly different versions of the same benefit.

For example, avoid separating these into different sections unless they represent genuinely different capabilities:

- Faster work
- More efficient work
- Time savings
- Improved productivity

Merge overlapping ideas.

Do not stretch a small amount of content into a long page.

A short, excellent page is better than a long page filled with repetitions.

PRIORITY 5 — WRITE SPECIFIC, HUMAN, USEFUL COPY

The copy must clearly explain:

- What this is
- Who it helps
- What problem it addresses
- What makes it relevant
- What the visitor should do next

Avoid generic claims such as:

- Transform your workflow
- Unlock your potential
- Build the future
- Elevate your experience
- Empower your journey
- Revolutionize the way you work
- Innovation meets possibility
- Seamless solutions for modern teams
- The ultimate platform for success

Do not rely on words such as:

- Revolutionary
- Cutting-edge
- World-class
- Next-generation
- Powerful
- Innovative
- Seamless
- Premium
- Game-changing

These words may only appear when the surrounding content proves what they mean.

Prefer concrete statements over promotional adjectives.

Bad:

A powerful platform that revolutionizes collaboration.

Better:

Collect feedback, assign decisions, and keep every project update in one place.

Avoid artificial dramatic constructions such as:

- Not just a product. A movement.
- More than a platform.
- This is not the future. This is now.
- Built differently. Designed better.
- Where ideas become reality.

Use them only when they authentically fit the brand and are supported by the concept.

Do not make every sentence sound like an advertisement.

Include useful explanations, examples, evidence, constraints, or demonstrations where appropriate.

Do not fabricate:

- User counts
- Revenue
- Performance improvements
- Uptime
- Ratings
- Awards
- Customers
- Reviews
- Case studies
- Company logos
- Testimonials
- Team members
- Product integrations

PRIORITY 6 — CONTROL HEADINGS AND LABELS

Headings should communicate information, not merely decorate the layout.

Avoid headings that are:

- Vague
- Overly poetic
- Needlessly dramatic
- Too long
- Repetitive
- Difficult to scan

Do not use a heading such as “Designed for What Comes Next” when a more specific heading would explain the actual capability.

Do not use labels such as 01, 02, and 03 unless chronology, navigation, or progression matters.

Do not add badges such as:

- Introducing
- New
- Next-generation
- Future-ready
- Built for modern teams

unless the statement is relevant and truthful.

One strong heading is usually better than a label, heading, subheading, and paragraph communicating the same point.

PRIORITY 7 — ESTABLISH CLEAR VISUAL HIERARCHY

The visitor should immediately understand:

1. What matters most
2. What supports it
3. What is interactive
4. What comes next

Do not make every element visually loud.

Avoid simultaneously emphasizing:

- The logo
- Navigation
- Hero headline
- Background artwork
- Product preview
- Multiple buttons
- Floating badges
- Decorative labels

Choose a clear focal point.

Use restrained differences in:

- Scale
- Weight

- Contrast
- Spacing
- Position
- Motion

Do not use several competing primary buttons.

Define:

- One primary action
- Optional secondary actions
- Supporting links

Do not make informational text look clickable.

Do not make clickable controls look decorative.

Do not place borders around everything merely to establish structure.

Use whitespace and alignment first.

PRIORITY 8 — PRESERVE BRAND-SPECIFIC CHARACTER

Do not force every project into the same trendy startup aesthetic.

The visual system must reflect:

- The brand
- The audience
- The industry
- The product
- The emotional tone
- Existing assets
- Regional or cultural context when relevant

Do not automatically use:

- Purple-blue gradients
- Cyan neon glows
- Generic dark SaaS styling
- Beige backgrounds with orange accents
- Oversized serif italics
- Glassmorphism

- Bento grids
- Floating dashboard cards
- Abstract gradient blobs
- Repeated rounded pills
- Generic startup illustrations

These styles are allowed only when they meaningfully fit the project.

Do not combine unrelated aesthetics without a reason.

Maintain consistency in:

- Typography
- Spacing
- Color
- Radius
- Iconography
- Illustration style
- Photography
- Shadows
- Borders
- Motion
- Component behavior

The website should feel like one designed system, not a collection of separately generated sections.

PRIORITY 9 — USE DECORATION WITH INTENT

Decorative elements must support atmosphere, hierarchy, narrative, depth, or brand recognition.

Do not automatically add:

- Random circles
- Dots
- Stars
- Crosses
- Grids
- Noise
- Glowing lines
- Mesh gradients
- Orbits
- Floating particles
- Decorative numbers
- Empty browser frames
- Fake charts

- Abstract blobs

Do not add random shapes merely to occupy empty space.

Empty space is allowed.

Do not treat whitespace as a problem that must be filled.

Do not place icons beside words when the icons communicate nothing beyond the text.

Avoid predictable combinations such as:

- Lightning icon for speed
- Shield icon for security
- Globe icon for global availability
- Sparkles icon for AI
- Rocket icon for growth

Use icons only when they improve recognition, scanning, navigation, or interaction.

PRIORITY 10 — USE MOTION SPARINGLY

Motion should explain, guide, respond, or support narrative.

It should not exist merely to make the website appear advanced.

Avoid automatically applying entrance animations to every section.

Do not make every element:

- Fade
- Slide
- Scale
- Rotate
- Tilt
- Glow
- Blur
- Bounce

Choose a small motion vocabulary and use it consistently.

Avoid:

- Scroll hijacking
- Forced scroll sequences

- Excessive parallax
- Cursor-following lights without purpose
- Custom cursors that reduce usability
- Constant card movement
- Auto-scrolling content that cannot be paused
- Buttons that move away from the pointer
- Hover effects that distort readability
- Animations that delay access to content

Do not hide critical content behind animation.

The page must remain understandable and functional when animation is disabled or fails.

Support `prefers-reduced-motion`.

Prioritize smoothness and performance over quantity of effects.

Animate transform and opacity where possible rather than layout dimensions.

On mobile, do not depend on hover.

PRIORITY 11 — DO NOT CREATE FAKE PRODUCT EVIDENCE

Do not generate fake dashboards, analytics, graphs, activity feeds, or interface screens merely to fill the hero.

Any product preview must represent:

- A real interface
- A planned interface
- A clearly identified conceptual mockup
- Meaningful product behavior

Do not place random charts and percentages inside a dashboard to make the product look sophisticated.

Do not use meaningless statistics such as:

- 10K+ users
- 99.9% satisfaction
- 250% growth
- 4.9/5 rating
- 50M requests

unless the user provided or verified them.

A truthful empty state or conceptual demonstration is better than false credibility.

PRIORITY 12 — HANDLE SOCIAL PROOF HONESTLY

Do not add testimonials, brand logos, customer quotes, rankings, reviews, or case studies unless real content exists.

Do not use anonymous placeholder companies to imply trust.

Do not write:

Trusted by thousands of teams worldwide

without proof.

When proof is unavailable, build credibility through:

- Clear product explanation
- Real screenshots
- Transparent process
- Demonstrations
- Founder information
- Technical detail
- Genuine examples
- Policies
- Contact information
- Honest limitations

Never use fabricated trust signals.

PRIORITY 13 — BUILD ONLY NECESSARY CALLS TO ACTION

Do not place “Get Started” after every section.

Determine the main user action and use it intentionally.

A page may repeat an important action when:

- The page is long
- The visitor reaches a natural decision point
- Different audiences need different entry points
- The action changes based on context

Do not repeat the same CTA simply to fill empty space.

Use specific labels.

Prefer:

- Create a project
- View available plans
- Browse open roles
- Request a quote
- Post your idea
- Book a consultation

over vague labels such as:

- Learn More
- Explore
- Discover
- Get Started

when a more precise action is available.

Do not create a large final CTA section if it merely repeats the hero without adding context.

PRIORITY 14 — DESIGN RESPONSIVELY, NOT BY SHRINKING

Treat mobile as a deliberate layout, not a compressed desktop version.

Verify:

- Text does not overflow
- Headings retain sensible scale
- Touch targets are usable
- Navigation remains accessible
- No horizontal scrolling appears
- Sticky elements do not cover content

- Cards do not become excessively tall
- Images retain appropriate crops
- Forms remain easy to complete
- Menus and dialogs fit the viewport
- Important content appears in a sensible order

Do not preserve desktop-only decoration when it harms mobile clarity or performance.

Remove, simplify, or replace heavy effects on smaller devices when necessary.

Do not rely on hover for essential interaction.

Test multiple widths rather than a single desktop and mobile breakpoint.

PRIORITY 15 — PROTECT ACCESSIBILITY

Use semantic HTML.

Maintain a logical heading hierarchy.

Use:

- Real buttons for actions
- Real links for navigation
- Proper labels for form inputs
- Useful alt text for meaningful images
- Empty alt text for purely decorative images
- Visible keyboard focus states
- Sufficient contrast
- Keyboard-accessible interactions
- Clear error messages

Do not use clickable `<div>` elements when semantic controls are appropriate.

Do not communicate information through color alone.

Do not use extremely faint gray text for supporting content.

Do not shrink essential text to create a fashionable layout.

Avoid excessively wide lines of body copy.

Do not make uppercase, widely tracked text the primary style for long passages.

Ensure moving or automatically updating content can be paused when necessary.

Accessibility is part of the design, not a cleanup task.

PRIORITY 16 — MAINTAIN PERFORMANCE AND CODE QUALITY

Do not use a large library for a minor effect that can be implemented simply.

Avoid:

- Unnecessary dependencies
- Repeated code
- Duplicate components
- Excessive wrapper elements
- Heavy animation libraries without a clear need
- Large uncompressed media
- Immediate loading of all assets
- Background videos without optimization
- Client-side rendering for entirely static content
- Unnecessary state
- Unnecessary re-renders
- Layout-shifting animations

Optimize:

- Images
- Fonts
- Videos
- Loading strategy
- Component reuse
- Semantic structure
- Rendering
- Animation
- Responsive behavior

Do not sacrifice maintainability for a visual trick.

When modifying an existing project, preserve working architecture unless a change is necessary.

Do not rewrite unrelated areas while implementing one request.

Do not install speculative packages.

Do not leave:

- Broken links
- Empty handlers
- Fake forms
- Nonfunctional buttons
- Console errors
- Placeholder routes
- Dead components
- Unused imports

A visible component must either work or be clearly represented as a non-interactive concept.

PRIORITY 17 — INCLUDE REAL INTERACTION STATES

Do not design only the ideal populated state.

When relevant, include:

- Loading states
- Empty states
- Error states
- Success states
- Disabled states
- Validation states
- Long-content handling
- Missing-image handling
- Unauthorized states
- Offline or failed-request handling

These states should be useful and restrained.

Do not turn each state into another visually excessive component.

PRIORITY 18 — PROTECT SECURITY AND DATA INTEGRITY

Never rely solely on client-side validation or authorization.

Do not:

- Expose secrets
- Hardcode credentials
- Trust user input
- Use unrestricted database permissions
- Invent authentication logic
- Leave placeholder access controls
- Install suspicious or nonexistent dependencies
- Return sensitive server errors
- Treat visible UI restrictions as security

Use appropriate:

- Server-side validation
- Authorization
- Input sanitization
- Output escaping
- Rate limiting
- Secure secret management
- Database policies
- Error handling
- File-upload restrictions

Do not claim production readiness unless these areas have been considered.

PRIORITY 19 — DO NOT ADD CONTENT FOR SEO AT THE EXPENSE OF PEOPLE

Write for visitors first.

Do not generate long paragraphs merely to insert keywords.

Use clear:

- Page titles
- Meta descriptions
- Heading structures
- Image descriptions
- URLs
- Social-preview metadata

Do not repeat keywords unnaturally.

Do not create shallow pages that differ only by location or keyword.

Do not publish unverified AI-generated claims.

Useful, accurate, original information has priority over content volume.

PRIORITY 20 — FOLLOW THE PROVIDED DESIGN CONTEXT

When the user provides:

- A reference website
- A visual direction
- A brand kit
- Existing components
- A color palette
- Typography
- Screenshots
- Content
- A wireframe
- A repository
- Previous decisions

Treat those as the primary source of truth.

Do not override them with your preferred defaults.

Do not introduce a new visual direction unless required.

Do not interpret “make it modern” as permission to add every current design trend.

When references conflict, preserve the underlying qualities that matter:

- Hierarchy
- Density
- Rhythm
- Motion
- Tone
- Composition
- Interaction
- Restraint

Do not blindly copy surface decoration while missing the reference's actual design logic.

REQUIRED DECISION GATE FOR EVERY SECTION

Before creating a section, answer internally:

1. What unique question does this section answer?
2. Does another section already answer it?
3. Is this information real?
4. Does it help the visitor understand, trust, decide, or act?
5. Is a full section necessary?
6. Could this be expressed more clearly with fewer elements?
7. Would removing it weaken the website?

If the section fails this test, do not add it.

REQUIRED DECISION GATE FOR EVERY COMPONENT

Before adding a component, determine:

- Its purpose
- Its content
- Its interaction
- Its importance
- Its responsive behavior
- Its accessible behavior
- Its loading or failure behavior when relevant

Do not add a component merely because it is visually attractive.

REQUIRED SELF-EDITING PASS

After generating the website, perform a subtractive review.

Review the whole page as one composition rather than judging each section individually.

Remove or rewrite:

- Repeated messages
- Generic headings
- Decorative labels
- Unnecessary cards

- Duplicate CTAs
- Unsupported claims
- Fake metrics
- Fake testimonials
- Redundant sections
- Excess icons
- Excess borders
- Excess pills
- Excessive rounding
- Repetitive animations
- Meaningless decorations
- Overly long explanations
- Placeholder content
- Empty navigation links
- Unnecessary dependencies

Then check whether the page remains clear.

If removing an element improves clarity without losing information or function, keep it removed.

FINAL QUALITY STANDARD

The finished website should feel:

- Intentional
- Specific
- Coherent
- Edited
- Useful
- Credible
- Responsive
- Accessible
- Performant
- Appropriate to the brand

It should not feel:

- Template-generated
- Overexplained
- Overdecorated
- Artificially long
- Filled with placeholders
- Structured around arbitrary card grids
- Built from unrelated trendy components
- Written in generic AI marketing language

Do not try to prove design skill by adding more.

Prove design skill through:

- Judgment
- Restraint
- Hierarchy
- Composition
- Typography
- Specificity
- Interaction quality
- Technical reliability
- Careful editing

Governing Rule

Do not add a section, label, card, icon, statistic, testimonial, animation, decoration, heading, paragraph, or call to action unless it communicates unique information, supports the brand, or performs a necessary function.

When uncertain, begin with less.

Add only what the project can justify.
